defines a startup as an organization dedicated to creating something new under conditions of extreme uncertainty. This is just as true for one person in a garage or a group of seasoned professionals in a Fortune 500 boardroom. What they have in common is a mission to penetrate that fog of uncertainty to discover a successful path to a sustainable business. The Lean Startup approach fosters companies that are both more capital efficient and that leverage human creativity more effectively. Inspired by lessons from lean manufacturing, it relies on “validated learning,” rapid scientific experimentation, as well as a number of counter-intuitive practices that shorten product development cycles, measure actual progress without resorting to vanity metrics, and learn what customers really want. It enables a company to shift directions with agility, altering plans inch by inch, minute by minute. Rather than wasting time creating elaborate business plans, The Lean Startup offers entrepreneurs—in companies of all sizes—a way to test their vision continuously, to adapt and adjust before it's too late. Osborn, 2019-09-05 Intellectual property (IP) laws were drafted for tangible objects, but 3D printing technology, which digitizes objects and offers manufacturing capacity to anyone, is disrupting these laws and their underlying policies. In this timely work, Lucas S. Osborn focuses on the novel issues raised for IP law by 3D printing for the major IP systems around the world. He specifically addresses how patent and design law must wrestle with protecting digital versions of inventions and policing individualized manufacturing, how trademark law must confront the dissociation of design from manufacturing, and how patent and copyright law must be reconciled when digital versions of primarily utilitarian objects are concerned. With an even hand and keen insight, Osborn offers an innovation-centered analysis of and balanced response to the disruption caused by 3D printing that should be read by nonexperts and experts alike.
