The Core Technology of MF Permatran III

The MF Permatran III is engineered around a sophisticated permeation testing methodology, designed to accurately measure the rate at which gases and vapors penetrate through barrier materials. This advanced system utilizes a differential pressure technique, a cornerstone of its precision. Unlike older methods that might rely on single-sided measurements or less sensitive detection mechanisms, the Permatran III employs a dual-chamber design. One

chamber is exposed to the test gas or vapor under controlled pressure, while the other is maintained at a lower pressure, often a vacuum. The gas or vapor that permeates through the material sample migrates from the high-pressure side to the low-pressure side. The MF Permatran III meticulously quantifies this flow, providing highly accurate data on permeability coefficients.

At the heart of the MF Permatran III's technological prowess is its advanced sensor array. These sensors are calibrated to detect even minute quantities of permeated substances, ensuring that even materials with exceptionally low permeability can be accurately characterized. The system's sophisticated data acquisition and processing software transforms raw sensor readings into actionable insights, presenting permeability values in standard units. This eliminates ambiguity and facilitates direct comparison of different materials or formulations. The control over environmental parameters such as temperature and humidity is also paramount to the Permatran III's accuracy. These variables can significantly influence permeation rates, and the system's ability to maintain them within tight tolerances is critical for reproducible and reliable results. The inherent design focuses on minimizing edge effects and ensuring uniform exposure of the test sample, further enhancing the integrity of the permeation measurements.

Key Components and Design Features

The robust construction and intelligent design of the MF Permatran III contribute significantly to its performance and longevity. A primary component is the sample holder, which is meticulously engineered to provide a leak-tight seal around the test material. This ensures that any detected permeation is solely through the material itself and not due to seal breaches. The holder is typically constructed from inert materials to prevent chemical reactions with the test substances. Another critical element is the pressure control system, which allows for precise setting and maintenance of the differential pressure across the sample. This system often incorporates high-precision regulators and sensors to ensure stability throughout the test duration. The gas delivery and evacuation systems are also vital, enabling the introduction of specific test gases or vapors and the controlled removal of permeated substances.

The detection system within the MF Permatran III is where its advanced capabilities truly shine. This can involve a variety of sensor technologies, such as mass spectrometers, coulometric sensors, or infrared detectors, depending on the specific gases or vapors being analyzed. These detectors are chosen for their sensitivity, selectivity, and stability. The environmental control chamber, if integrated, plays a crucial role in mimicking real-world conditions. It allows for precise regulation of temperature and humidity, which are often key factors affecting barrier properties. The user interface, typically a sophisticated software package, is another key feature. It provides intuitive control over test parameters, real-time data monitoring, and comprehensive report generation. The overall design emphasizes ease of use, robustness, and the ability to handle a wide range of materials and testing conditions.

Applications of MF Permatran III Across Industries

The versatility and accuracy of the MF Permatran III have made it an indispensable tool across a multitude of industries. In the packaging sector, it is extensively used to evaluate the barrier properties of films, laminates, and containers for food, pharmaceuticals, and sensitive electronic components. This ensures optimal product shelf-life and prevents degradation due to gas or moisture ingress. For the automotive industry, the MF Permatran III is critical in testing the permeability of materials used in fuel tanks, hoses, and interior components, ensuring compliance with emissions regulations and preventing the escape of volatile organic compounds (VOCs). The medical device industry relies on the Permatran III to assess the barrier performance of packaging for sterile medical supplies, ensuring product integrity and patient safety.

In the realm of textiles and apparel, the system is employed to evaluate the breathability and moisture vapor transmission rates (MVTR) of performance fabrics, crucial for outdoor gear and athletic wear. The construction and materials industries also benefit from its capabilities, utilizing it to test the vapor barrier properties of building materials like insulation, membranes, and coatings, contributing to energy efficiency and moisture control in structures. Furthermore, the research and development sector utilizes the MF Permatran III for material characterization and the development of new barrier materials with enhanced properties. Its ability to simulate a wide range of environmental conditions makes it ideal for understanding material performance under diverse stresses.

Operational Principles and Performance

The fundamental operational principle of the MF Permatran III revolves around creating a controlled environment to measure the rate of permeation. A precisely cut sample of the barrier material is mounted within the test cell, creating two isolated chambers. One chamber is pressurized with the test gas or vapor (e.g., oxygen, nitrogen, water vapor, CO₂) to a predetermined level. The other chamber is maintained at a significantly lower pressure, often a vacuum or atmospheric pressure, depending on the test setup. The pressure differential drives the permeation process. As molecules of the test substance pass through the material, they accumulate in the low-pressure chamber.

The MF Permatran III employs highly sensitive sensors to detect and quantify the concentration of the permeated substance in the low-pressure chamber over time. This data is then processed by sophisticated algorithms to calculate the permeability coefficient. The performance of the MF Permatran III is characterized by its high sensitivity, accuracy, and reproducibility. It can detect very low levels of permeation, making it suitable for advanced materials and stringent applications. The system's ability to maintain stable temperature and humidity conditions is crucial for obtaining reliable and comparable results, as these environmental factors significantly influence permeation rates. The speed of testing is also a key performance indicator, with advanced models offering efficient test cycles without compromising accuracy. The system's robust data logging and analysis capabilities ensure that users can easily interpret results and track material performance over

time.

Installation and Setup Considerations

Proper installation and setup of the MF Permatran III are critical to ensuring its optimal performance and the accuracy of the test results. The initial step involves selecting an appropriate location for the instrument. This area should be free from excessive vibrations, extreme temperature fluctuations, and direct sunlight, which can all interfere with the sensitive measurements. Adequate space should be allocated for the instrument itself, as well as for any necessary ancillary equipment such as gas cylinders, vacuum pumps, and exhaust ventilation. Power requirements must be carefully reviewed, and the installation should be performed by qualified personnel to ensure compliance with electrical safety standards.

Ventilation is another key consideration, especially when dealing with test gases or vapors that may be hazardous. The MF Permatran III system often requires connection to a laboratory exhaust system or the use of specific fume hoods to safely vent permeated substances. For gas supply, appropriate regulators and tubing made of compatible materials must be used to deliver the test gases without contamination or leaks. The calibration of the system is a crucial setup step. Regular calibration of the sensors and pressure controllers, ideally using certified calibration standards, is essential for maintaining the accuracy and reliability of the permeability measurements. Following the manufacturer's detailed installation and setup manual is paramount to avoid potential issues and to maximize the instrument's lifespan and operational efficiency. This includes proper grounding, leak checking of all connections, and familiarization with the software interface.

Maintenance and Troubleshooting for MF Permatran III

Consistent maintenance of the MF Permatran III is vital for ensuring its continued accuracy, reliability, and longevity. Routine checks should include inspecting seals and gaskets for any signs of wear or degradation, as these are critical for maintaining a leak-tight system. Cleaning of the sample holder and any accessible internal components, according to the manufacturer's recommendations, should be performed regularly to prevent contamination from sample residues. The calibration of sensors and pressure transducers should be scheduled and performed according to the manufacturer's guidelines or industry best practices. This typically involves using certified calibration gases or standards.

Troubleshooting common issues with the MF Permatran III often begins with a systematic approach. If inconsistent or unexpected results are obtained, the first step is to verify that all connections are secure and free from leaks, both for gas lines and the sample cell. Checking the integrity of the sample seal is also paramount. If the instrument reports errors, consulting the error codes and their meanings in the user manual is essential. Common error types might relate to pressure control, sensor readings, or communication failures. For pressure-related issues, checking the gas supply and the functionality of pressure regulators and control valves is important. Sensor

malfunctions might require cleaning, recalibration, or replacement of the sensor element. Software glitches can sometimes be resolved by restarting the instrument or the associated software. If persistent problems arise, contacting the manufacturer's technical support for specialized assistance is recommended.

Advantages of MF Permatran III Over Alternatives

The MF Permatran III offers several distinct advantages that set it apart from other permeation testing methods. One of the most significant benefits is its unparalleled accuracy and sensitivity. The differential pressure technique, coupled with advanced sensor technology, allows for the precise measurement of very low permeability rates, which is crucial for high-performance barrier materials. This level of precision is often unattainable with simpler, older testing methodologies.

Another key advantage is its versatility. The MF Permatran III can be configured to test a wide range of gases and vapors, including oxygen, nitrogen, carbon dioxide, water vapor, and various organic vapors. This adaptability makes it suitable for diverse applications across numerous industries, eliminating the need for multiple specialized instruments. Furthermore, the system's ability to control and monitor environmental parameters like temperature and humidity ensures that tests can be conducted under conditions that closely mimic real-world applications, leading to more relevant and predictive data. The automated nature of the MF Permatran III also contributes to its advantages. Automated sample loading, test parameter control, and data acquisition reduce the risk of human error, improve efficiency, and enable unattended operation, allowing for continuous testing and higher throughput. The robust reporting capabilities of the accompanying software also provide comprehensive data analysis and documentation, simplifying compliance and comparison. These factors collectively position the MF Permatran III as a superior choice for demanding permeation testing requirements.

mf permatran iii: Polymer Permeability J. Comyn, 2012-12-06 Polymers are permeable, whilst ceramics, glasses and metals are generally impermeable. This may seem a disadvantage in that polymeric containers may allow loss or contamination of their contents and aggressive substances such as water will diffuse into polymeric structures such as adhesive joints or fibre-reinforced composites and cause weakening. However, in some cases permeability is an advantage, and one particular area where this is so is in the use of polymers in drug delivery systems. Also, without permeable polymers, we would not enjoy the wide range of dyed fabrics used in clothing and furnishing. The fundamental reason for the permeability of polymers is their relatively high level of molecular motion, a factor which also leads to their high levels of creep in comparison with ceramics, glasses and metals. The aim of this volume is to examine some timely applied aspects of polymer permeability. In the first chapter basic issues in the mathematics of diffusion are introduced, and this is followed by two chapters where the fundamental aspects of diffusion in polymers are presented. The following chapters, then, each examine some area of applied science where permeability is a key issue. Each chapter is reasonably self-contained and intended to be informative without frequent outside reference. This inevitably leads to some repetition, but it is hoped that this is not excessive.

mf permatran iii: Functional Polymers in Food Science Giuseppe Cirillo, Umile Gianfranco Spizzirri, Francesca Iemma, 2015-03-10 Polymers are an important part in everyday life; products made from polymers range from sophisticated articles, such as biomaterials, to aerospace materials. One of the reasons for the great popularity exhibited by polymers is their ease of processing. Polymer properties can be tailored to meet specific needs by varying the atomic composition of the repeat structure, by varying molecular weight and by the incorporation (via covalent and non-covalent interactions) of an enormous range of compounds to impart specific activities. In food science, the use of polymeric materials is widely explored, from both an engineering and a nutraceutical point of view. Regarding the engineering application, researchers have discovered the most suitable materials for intelligent packaging which preserves the food quality and prolongs the shelf-life of the products. Furthermore, in agriculture, specific functionalized polymers are used to increase the efficiency of treatments and reduce the environmental pollution. In the nutraceutical field, because consumers are increasingly conscious of the relationship between diet and health, the consumption of high quality foods has been growing continuously. Different compounds (e.g. high quality proteins, lipids and polysaccharides) are well known to contribute to the enhancement of

human health by different mechanisms, reducing the risk of cardiovascular disease, coronary disease, and hypertension. This first volume, of this two volume book, concerns the application of polymers in food packaging.

mf permatran iii: Food Packaging and Preservation M. Mathlouthi, 2013-12-14 This book is an updating of *Food Packaging and Preservation, Theory and Practice* published in 1986 by Elsevier Applied Science. Since that date, many things have changed in the world. Hence the name given to the first IFTEC meeting held at the Hague (NL), November 15-18, 1992 *Food Technology for a Changing World*. Is the world changing for better or worse and what can food technology improve? The keynote lecture of the IFTEC meeting dealt with hunger and the challenge it represents to food science and technology. In the preface to the 1986 book it was suggested that food packaging could solve some of the problems of crop preservation in countries where starvation is prevalent. However, such thoughts did not solve any problems. The famine is still spreading in Africa. The unbalanced north-south situation evoked in the 1986 preface has not improved. The international market of foods and agricultural products is constantly changing and food packaging scientists can only explore new ways to help cope with this. Some of these ideas are approached in this book, particularly in chapters 9, 10 and 12.

The authors consider the development of the right package for a particular food in a particular market, from the point of view of the food technologist, the packaging engineer and those concerned with marketing. While the original format has been retained, the contents have been thoroughly revised to take account of the considerable advances made in recent years in the techniques of food processing, packaging and distribution. While efficient packaging is even more a necessity for every kind of food, whether fresh or processed, and is an essential link between the food producer and the consumer, the emphasis on its several functions has changed. Its basic function is to identify the product and ensure that it travels safely through the distribution system to the consumer. Packaging designed and constructed solely for this purpose adds little or nothing to the value of the product, merely preserving farm or processor freshness or preventing physical damage, and cost effectiveness is the sole criterion for success. If, however, the packaging facilitates the use of the product, is reusable or has an after-use, some extra value can be added to justify the extra cost and promote sales. Many examples of packaging providing such extra value can be cited over the last decade.

mf permatran iii: Edible Films and Coatings for Food Applications Milda E. Embuscado, Kerry C. Huber, 2009-06-10 Edible films and coatings play an important role in the quality, safety, transportation, storage, and display of a wide range of fresh and processed foods. Edible films and coatings, while preventing moisture loss and maintaining quality, prevent spoilage and microbial contamination of foods. The edible film and coating industry is now a multimillion dollar industry. Less than \$1 million in 1999, the market has grown to more than \$100 million and is expected to grow to \$350 million by 2008, according to James Rossman of Rossman Consulting. Pharmaceutical and consumer products have been responsible for the tremendous increase. This growth has produced an enormous amount of scientific articles, patents, and research projects undertaken by members of the food industry, academia, and research institutions. *Edible Films and Coatings for Food Applications* brings together this vast wealth of scientific knowledge in a systematically organized volume. It examines the science, application, function, and market for edible films and coatings.

mf permatran iii: Moisture Sorption Leonard N. Bell, Theodore Peter Labuza, 2000 This manual explains water activity in foods and shows why commonly held ideas about free and bound water are often inaccurate. It demonstrates how moisture sorption isotherms are created and how they are used to solve real-world problems such as the change in rate of moisture gain for individual packaged products over time, or the amount of sugar needed to lower the water activity of a product to make it shelf stable. The authors emphasize the physical chemistry of water in biological systems. For every equation provided they furnish examples from practical experience. These examples will help food scientists understand thermodynamics (equilibrium processes and water activity), dynamics (rate processes such as mass transfer of moisture between ingredients), and structure (weeping, swelling, droplets, and edible barriers). Using this manual will help solve product development problems and improve the quality of the foods brought to the market.

mf permatran iii: Modification of Polymer Properties Carlos Federico Jasso-Gastinel, José M. Kenny, 2016-09-14 Modification of Polymer Properties provides, for the first time, in one title, the latest information on gradient IPNs and gradient copolymers. The book covers the broad range of polymer modification routes in a fresh, current view representing a timely addition to the technical literature of this important area. Historically, blends, copolymers, or filled polymers have been developed to meet specific properties, or to optimize the cost/properties relationship. Using the gradient structure approach with conventional radical polymerization, it has been shown that it is possible to optimize properties if appropriate gradients in the composition of copolymer chains are obtained. An overview of the gradient structure approach for designing polymers has not appeared in the recent literature and this title covers the different methods used to modify properties, offering the whole range of ways to modify polymers in just one volume and making this an attractive option for a wide audience of practitioners. The approach for each chapter is to explain the fundamental principles of preparation, cover properties modification, describe future research and applications as examples of materials that may be prepared for specific applications, or that are already in use, in present day applications. The book is for readers that have a basic background in polymer science, as well as those interested in the different ways to combine or modify polymer properties. - Provides an integrated view on how to modify polymer properties - Presents the entire panorama of polymer properties modification in one reference, covering the essential information in each topic - Includes the optimization of properties using gradients in polymers composition or structure

mf permatran iii: Polymer Composites Klaus Friedrich, Stoyko Fakirov, Zhong Zhang, 2005-12-06 The use of polymer composites in various engineering applications has become state of the art. This multi-author volume provides a useful summary of updated knowledge on polymer composites in general, practically integrating experimental studies, theoretical analyses and computational modeling at different scales, i. e. , from nano- to macroscale. Detailed consideration is given to four major areas: structure and properties of polymer nanocomposites, characterization and modeling, processing and application of macrocomposites, and mechanical performance of macrocomposites. The idea to organize this volume arose from a very impressive workshop - The First International Workshop on Polymers and Composites at IVW Kaiserslautern: Invited Humboldt-Fellows and Distinguished Scientists, which was held on May 22-24, 2003 at the University of Kaiserslautern, Germany. The contributing authors were invited to incorporate updated knowledge and developments into their individual chapters within a year after the workshop, which finally led to these excellent contributions. The success of this workshop was mainly sponsored by the German Alexander von Humboldt Foundation through a Sofia Kovalevskaja Award Program, financed by the Federal Ministry for Education and Research within the Investment in the Future Program of the German Government. In 2001, the Humboldt Foundation launched this new award program in order to offer outstanding young researchers throughout the world an opportunity to establish their own work-groups and to develop innovative research concepts virtually in Germany. mf permatran iii: Packaging Closures and Sealing Systems Nigel Theobald, Belinda Winder, 2009-02-11 The packaging closure is the primary interface between the product and the customer. Closures have undergone much evolution and development in recent years. The basic function of a closure is to allow easy access to a packaged product and to reclose the package, when the contents are not used fully in a single serve. However, closures are now expected to deliver a wide variety of additional functions, such as ensuring that the package has not been opened prior to the first opening by the consumer, facilitating the dispensing of the product (especially for food and pharmaceuticals) and supporting the brand equity value of the product. This volume considers the technologies relevant to packaging closures and sealing systems, structured by types of pack. It is directed at packaging technologists, those involved in the design and development of packaging and those who specify or purchase packaging.

mf permatran iii: Biodegradable polymers for industrial applications Ray Smith, 2005-05-17 The vast majority of plastic products are made from petroleum-based synthetic polymers that do not degrade in a landfill or in a compost-like environment. Therefore, the disposal of these products poses a serious environmental problem. An environmentally-conscious alternative is to design/synthesize polymers that are biodegradable. Biodegradable polymers for industrial applications introduces the subject in part one by outlining the classification and development of biodegradable polymers with individual chapters on polyhydroxyalkanoates, polyesteramides and thermoplastic starch biodegradable polymers and others. The second part explores the materials available for the production of biodegradable polymers. Polymers derived from sugars, natural fibres, renewable forest resources, poly(lactic acid) and protein-nanoparticle composites will be looked at in detail in this section. Part three looks at the properties and mechanisms of degradation, prefacing the subject with a chapter on current standards. The final part explores opportunities for industrial applications, with chapters on packing, agriculture and biodegradable polycaprolactone foams in supercritical carbon dioxide. Biodegradable polymers for industrial applications explores the fundamental concepts concerning the development of biodegradable polymers, degradable polymers from sustainable sources, degradation and properties and industrial applications. It is an authoritative book that will be invaluable for academics, researchers and policy makers in the industry.
