core practice 6b 2: Principles and Practice of Constraint Programming - CP 2010 David Cohen, 2010-09-07 The 16th annual International Conference on the Principles and Practice of Constraint Programming (CP 2010) was held in St. Andrews, Scotland, during September 6-10, 2010. We would like to thank our sponsors for their generous support of this event. This conference is concerned with all aspects of computing with constraints, including: theory, algorithms, applications, environments, languages, models and systems. We received a wide variety of submissions, each of which was reviewed by at least three referees. Referees were chosen for each submission by an initial bidding process where Program Committee members chose papers from their area of interest. The range of expertise represented by the large Program Committee meant that almost all submissions were reviewed by subject experts on the Program Committee, or by colleagues chosen by members of the Program Committee for their particular expertise. Papers were solicited either as long (15 page), or short (8 page) submissions. Short-paper submissions were refereed to exactly the same high standards as long-paper submissions but naturally were expected to contain a smaller quantity of new material. Thus there is no distinction in these proceedings between short and long papers. I used the excellent EasyChair conference management system to support this process of reviewing, and for the collation and organization of these proceedings. Submissions were made either to the applications track or to the research track. There were 101 (23 short) research track submissions of which 36 (8 short) were accepted, which is a 36% (35% of short) acceptance rate. Application track submissions received special consideration and the acceptance rate was significantly higher than for the research track.

core practice 6b 2: Questions in Daily Urologic Practice Ryoichi Oyasu, Ximing J. Yang, Osamu Yoshida, 2009-02-21 The principal role of the diagnostic surgical pathologist is to serve a patient by assisting the clinician in charge of the patient's care. In that capacity, the pathologist provides the vital information that should be directly and indirectly useful in guiding the clinician toward the most appropriate therapy. The material pathologists receive most commonly is a biopsy

or a part of an organ removed after a definitive procedure. To extract useful information, pathological evaluation proceeds according to a set of guidelines. Simply reporting a diagnosis of cancer is inadequate. Detailed additional information is needed so that the clinician can go on to establish a therapeutic plan as needed. To best serve the patient, close interaction between the clinician and the pathologist is vital. In the field of urological pathology, there are problems specific to this system. Typically, in the prostate, because of its location, there is little room for a surgeon to work to obtain adequate resection margins, unlike with many other organs. As a result, questions arise such as What constitutes an adequate surgical margin? What is the significance of extraprostatic extension of neoplasm that is still inside the resection margin? and What is the significance of neoplastic glands found on the resection margin marked with the ink? It has been shown that a prostate needle core biopsy can generate much information that is immediately useful in predicting the extent of cancer in the prostate and, consequently, the outcome for the patient.
